## COMPOUNDS USEFUL AS REVERSIBLE INHIBITORS OF CATHEPSIN S

### RELATED APPLICATIONS

The benefit of prior provisional application Serial Number 60/122,570, filed on March 2,  
5 1999, is hereby claimed.

### TECHNICAL FIELD OF THE INVENTION

This invention relates to peptidyl cysteine protease inhibitors. The compounds are  
10 reversible inhibitors of the cysteine protease cathepsin S and are therefore useful in the  
treatment of autoimmune diseases. The invention also relates to processes for preparing  
such compounds and pharmaceutical compositions comprising them.

### BACKGROUND OF THE INVENTION

15 Cathepsin S is a member of the papain family, within the papain superfamily of cysteine  
proteases. The papain family is the largest group of cysteine proteases and includes  
proteases such as cathepsins B, H, K, L, O and S. (A.J. Barrett et al., 1996, Perspectives  
in Drug Discovery and Design, 6, 1). The cysteine proteases have important roles in  
20 human biology and diseases including atherosclerosis, emphysema, osteoporosis, chronic  
inflammation and immune disorders (H.A. Chapman et al., 1997, Ann. Rev. Physiol., 59,  
63). Cathepsin S plays a key role in regulating antigen presentation and immunity (H.A.  
Chapman, 1998, Current Opinion in Immunology, 10, 93; R. J. Riese et al., 1998, J. Clin.  
Invest., 101, 2351; R.J. Riese et al., 1996, Immunity, 4, 357).

25 The specificity of the immune response relies on processing of foreign protein and  
presentation of antigenic peptide at the cell surface. Antigenic peptide is presented bound  
to MHC Class II, a heterodimeric glycoprotein expressed in certain antigen presenting  
cells of hematopoietic lineage, such as B cells, macrophages and dendritic cells.  
30 Presentation of antigen to effector cells, such as T-cells, is a fundamental step in  
recognition of non-self and thus initiation of the immune response.

Recently MHC Class II heterodimers were shown to associate intracellularly with a third molecule designated invariant chain. Invariant chain facilitates Class II transport to the endosomal compartment and stabilizes the Class II protein prior to loading with antigen.

5 Invariant chain interacts directly with Class II dimers in the antigen-binding groove and therefore must be proteolyzed and removed or antigen cannot be loaded or presented. Current research suggests that invariant chain is selectively proteolyzed by cathepsin S, which is compartmentalized with MHC Class II complexes within the cell. Cathepsin S degrades invariant chain to a small peptide, termed CLIP, which occupies the antigen –

10 binding groove. CLIP is released from MHC Class II the interaction MHC Class II with HLA-DM, a MHC-like molecule thus freeing MHC Class II to associate with antigenic peptides. MHC Class II-antigen complexes are then transported to the cell surface for presentation to T-cells, and initiation of the immune response.

Cathepsin S, through proteolytic degradation of invariant chain to CLIP, provides a

15 fundamental step in generation of an immune response. It follows that inhibition of antigen presentation via prevention of invariant chain degradation by cathepsin S could provide a mechanism for immuno-regulation. Control of antigen-specific immune responses has long been desirable as a useful and safe therapy for autoimmune diseases. Such diseases include Crohn's disease and arthritis, as well as other T-cell-mediated

20 immune responses (C. Janeway and P. Travers, 1996, Immunobiology, The Immune System in Health and Disease, Chapter 12). Furthermore, cathepsin S, which has broad pH specificity, has been implicated in a variety of other diseases involving extracellular proteolysis, such as Alzheimer's disease (U. Muller-Ladner et al., 1996, Perspectives in Drug Discovery and Design, 6, 87) and atherosclerosis (G.K. Sukhova et al., 1998, J.

25 Clin. Invest., 102, 576).

Cysteine proteases are characterized by having a cysteine residue at the active site which serves as a nucleophile. The active site also contains a histidine residue. The imidazole ring on the histidine serves as a base to generate a thiolate anion on the active site

30 cysteine, increasing its nucleophilicity. When a substrate is recognized by the protease, the amide bond to be cleaved is directed to the active site, where the thiolate attacks the

carbonyl carbon forming an acyl-enzyme intermediate and cleaving the amide, liberating an amine. Subsequently, water cleaves the acyl-enzyme species regenerating the enzyme and liberating the other cleavage product of the substrate, a carboxylic acid.

- 5 A proposed mechanism of action of the cysteine protease inhibitors of this invention is that the inhibitors contain a functionality that can react (reversibly or irreversibly) with the active site cysteine. The reactive functionality is attached to a peptide or peptide mimic that can be recognized and accommodated by the region of the protease surrounding the active site. The nature of both the reactive functionality and the  
10 remaining portion of the inhibitor determine the degree of selectivity and potency toward a particular protease.

Examples of reactive functionalities that have been described (D. Rasnick, 1996, Perspectives in Drug Discovery and Design, 6, 47) on cysteine protease inhibitors include  
15 peptidyl diazomethanes, epoxides, monofluoroalkanes and acyloxymethanes, which irreversibly alkylate the cysteine thiol. Other irreversible inhibitors include Michael acceptors such as peptidyl vinyl esters and other carboxylic acid derivatives (S. Liu et al., J. Med Chem., 1992, 35, 1067) and vinyl sulfones (J.T. Palmer et al., 1995, J. Med Chem., 38, 3193).

20 Reactive functionalities that form reversible complexes with the active site cysteine include peptidyl aldehydes (R.P. Hanzlik et al., 1991, Biochim. Biophys. Acta., 1073, 33), which are non-selective, inhibiting both cysteine and serine proteases as well as other nucleophiles. Peptidyl nitriles (R.P. Hanzlik et al., 1990, Biochim. Biophys. Acta., 1035,  
25 62) are less reactive than aldehydes and therefore more selective for the more nucleophilic cysteine proteases. Various reactive ketones have also been reported to be reversible inhibitors of cysteine proteases (D. Rasnick, 1996, *ibid*). In addition to reacting with the nucleophilic cysteine of the active site, reactive ketones may react with water, forming a hemiketal which may act as a transition state inhibitor.

30

Examples of cathepsin S inhibitors have been reported previously. J.T. Palmer (U.S. 5,776,718, 1998) described reversible peptidyl sulfones as inhibitors of cysteine proteases including cathepsin S. J.L. Klaus et al. (WO 9640737, 1996) described reversible inhibitors of cysteine proteases including cathepsin S, containing an ethylene diamine.

5

Additional peptidyl nitriles or peptidyl ketoheterocycles have been reported either as protease inhibitors or as having other utilities. For example, both nitriles and ketoheterocycles are described by B.A. Rowe et al. (US 5714471, 1998) as protease inhibitors useful in the treatment of neurodegenerative diseases. Peptidyl nitriles are reported by B. Malcolm et al. (WO 9222570, 1992) as inhibitors of picornavirus protease. H. Saika et al. (WO 9512611, 1995) report peptidyl nitriles among compounds having endothelin receptor antagonist activity. B.J. Gour-Salin (Can. J. Chem., 1991, 69, 1288) and T.C. Liang (Arch. Biochim. Biophys., 1987, 252, 626) described peptidyl nitriles as inhibitors of papain. D.W. Woolley et al. (J. Org. Chem., 1963, 28, 2012) described a peptidyl nitrile as a chemical intermediate.

Peptidyl ketoheterocycles having protease inhibiting or other activities have been reported, include inhibitors of serine proteases described by R. D. Tung et al. (WO 9817679, 1998). Inhibitors of Factor X<sub>a</sub> have been described by C.K. Marlowe et al. (WO 9640744, 1996). Peptidyl ketoheterocycles useful in the treatment of thrombin related diseases have been described by M. Costanzo et al. (WO 9640742, 1996).

A reversible inhibitor presents a more attractive therapy than irreversible inhibitors. Even compounds with high specificity for a particular protease can bind non-target enzymes. An irreversible compound could therefore permanently inactivate a non-target enzyme, increasing the likelihood of toxicity. Furthermore, any toxic effects resulting from inactivation of the target enzyme would be mitigated by reversible inhibitors, and could be easily remedied by modified or lower dosing. Finally, covalent modification of an enzyme by an irreversible inhibitor could potentially generate an antibody response by acting as a hapten.

In light of the above, there is a clear need for compounds which reversibly and selectively inhibit cathepsin S, such inhibitors would be useful in therapy for antigen-specific immune responses as well as for indications in which cathepsin S exacerbates disease through extracellular activity.

### BRIEF DESCRIPTION OF THE INVENTION

The work cited above supports the principle that inhibition of cathepsin S and subsequent inhibition of antigen presentation will be beneficial in the treatment of various disease states. It is therefore an object of this invention to provide novel compounds that inhibit antigen presentation by virtue of reversible inhibition of the cysteine protease cathepsin S. It is a further object of the invention to provide methods for treating diseases and pathological conditions involving immune disorders such as rheumatoid arthritis. It is yet a further object of the invention to provide processes for preparation of the above-mentioned novel compounds.

Any compounds of this invention containing one or more asymmetric carbon atoms may occur as racemates and racemic mixtures, single enantiomers, diastereomeric mixtures and individual diastereomers. All such isomeric forms of these compounds are expressly included in the present invention. Each stereogenic carbon may be in the R or S

20 configuration, or a combination of configurations.

Some of the compounds of formulas (I), (Ia) and formulas (II), (IIa) can exist in more than one tautomeric form. The invention includes all such tautomers.

25 It shall be understood by one of ordinary skill in the art that all compounds of the invention are those which are chemically stable.

The invention includes pharmaceutically acceptable derivatives of compounds of formulas (I), (Ia) and formulas (II), (IIa). A "pharmaceutically acceptable derivative" refers to any pharmaceutically acceptable salt or ester of a compound of this invention, or any other compound which, upon administration to a patient, is capable of providing (directly or indirectly) a compound of this invention, a pharmacologically active metabolite or pharmacologically active residue thereof. A pharmacologically active metabolite shall be understood to mean any compound of the invention capable of being

35 metabolized enzymatically or chemically. This includes, for example, hydroxylated or oxidized derivative compounds of the invention.

In addition, the compounds of this invention include prodrugs of compounds of the formulas (I),(Ia) and formulas (II), (IIa). Prodrugs include those compounds that, upon simple chemical transformation, are modified to produce the compounds of the invention. Simple chemical transformations include hydrolysis, oxidation and reduction. Specifically, when a prodrug of this invention is administered to a patient, the prodrug may be transformed into a compound of formulas (I),(Ia) or formulas (II), (IIa), thereby imparting the desired pharmacological effect.

In order that the invention herein described may be more fully understood, the following detailed description is set forth. As used herein, the following abbreviations are used:

BOC or t-BOC is tertiary butoxycarbonyl;

t-Bu is tertiary butyl;

DMF is dimethylformamide;

EtOAc is ethyl acetate;

THF is tetrahydrofuran;

Ar is argon;

TFA is trifluoroacetic acid;

EDC is 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride.

HOBT is 1-hydroxybenzotriazole

Also, as used herein, each of the following terms, used alone or in conjunction with other terms, are defined as follows (except where noted to the contrary):

The term "alkyl" refers to a saturated aliphatic radical containing from one to ten carbon atoms or a mono- or polyunsaturated aliphatic hydrocarbon radical containing from two to twelve carbon atoms, containing at least one double or triple bond, respectively. "Alkyl" refers to both branched and unbranched alkyl groups. Preferred alkyl groups are straight chain alkyl groups containing from one to eight carbon atoms and branched alkyl groups containing from three to eight carbon atoms. More preferred alkyl groups are

straight chain alkyl groups containing from one to six carbon atoms and branched alkyl groups containing from three to six carbon atoms. It should be understood that any combination term using an "alk" or "alkyl" prefix refers to analogs according to the above definition of "alkyl". For example, terms such as "alkoxy", "alkythio" refer to  
5 alkyl groups linked to a second group via an oxygen or sulfur atom. "Alkanoyl refers to an alkyl group linked to a carbonyl group (C=O).

The term "cycloalkyl" refers to the cyclic analog of an alkyl group, as defined above.  
10 Preferred cycloalkyl groups are saturated cycloalkyl groups containing from three to eight carbon atoms, and more preferably three to six carbon atoms.

The term "aryl" refers to phenyl and naphthyl. "Aroyl" refers to an aryl group linked to a  
15 carbonyl group (C=O).

The term "halo" refers to a halogen radical selected from fluoro, chloro, bromo or iodo. Preferred halo groups are fluoro, chloro and bromo.

20 The term "heteroaryl" refers to a stable 5-8 membered (but preferably, 5 or 6 membered) monocyclic or 8-11 membered bicyclic aromatic heterocycle radical. #### GENERAL SYNTHETIC METHODS

The invention also provides processes of making the present novel compounds. Compounds of the invention may be prepared by methods described below. Standard  
20 peptide coupling, protection and deprotection reactions (see for example M. Bodanszky, The Practice of Peptide Synthesis, Springer-Verlag, 1984) are employed in these syntheses.

Compounds of the invention having formula (II) or (IIa) (nitriles) may be prepared by  
25 Method A (Scheme I)

Scheme I (Method A)

According to Method A a suitably protected amino acid bearing R<sub>6</sub> is allowed to react with ammonia under standard coupling conditions. An example of a suitable protecting group is the *t*-butoxycarbonyl (Boc) group. An example of standard coupling conditions would be combining the starting materials in the presence of a coupling reagent such as 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide (EDC) with 1-hydroxybenzotriazole (HOBT), in a suitable solvent such as DMF or methylene chloride. A base such as N-methylmorpholine may be added. This is followed by deprotection to give amino acid amide III. An amino acid ester bearing R<sub>2</sub> and R<sub>3</sub> is then reacted with an acid chloride bearing R<sub>1</sub> in the presence of a suitable base such as N,N-diisopropylethylamine. Conversion to the carboxylic acid provides IV. Standard peptide coupling of III and IV, followed by dehydration of the amide provides the desired nitrile II or IIa. An example of suitable dehydration conditions is cyanuric chloride in DMF.

In a variation (Method B) illustrated in Scheme II, an amino acid amide bearing  $R_6$  is coupled with an amine-protected amino acid bearing  $R_2$  and  $R_3$ . A suitable protecting group and coupling conditions would be as described above. Deprotection is then  
 5 followed by reaction with an acid chloride bearing  $R_1$ . Conversion of the amide to the nitrile as above provides II or IIa.

Scheme II (Method B)

10

Compounds of the invention having formulas (I) or (Ia) (ketones) may be prepared by  
 15 Methods C (Scheme III) or D (Scheme IV) as described below.

15

Scheme III (Method C)

- According to Method C, a suitably protected (for example Boc protected) amino acid is
- 5 coupled with N,O-dimethylhydroxylamine under standard coupling conditions, such as with carbonyldiimidazole (CDI) in a solvent such as DMF, to give the corresponding amide. This is reduced to the aldehyde (V) with a suitable reducing agent such as  $\text{LiAlH}_4$ , in a suitable solvent such as THF.
- 10 The aldehyde (V) is reacted with the anion of a heterocycle  $\text{R}_8$ , which is generated by reacting  $\text{R}_8$  with a strong base such as  $\text{n-BuLi}$  in a solvent such as THF at a temperature of about  $-30^\circ\text{C}$  to  $-100^\circ\text{C}$  and preferably at about  $-78^\circ\text{C}$ . This is followed by removal of the protecting group providing alcohol (VI). This is coupled with (IV), prepared as described in Scheme I, under standard coupling conditions such as EDC and HOBT in

DMF in the presence of a base such as N-methylmorpholine to provide (VII). Oxidation of (VII) with, for example, the Dess Martin Reagent (1,1,1-triacetoxy-1,1-dihydro-1,2-benziodoxol-3(1H)-one) in methylene chloride and t-BuOH, provides the desired ketone of formulas (I) or (Ia).

5

## Scheme IV (Method D)

- 10 In Method D, a suitably protected amino acid N-methoxy-N-methylamide (prepared as described in Scheme III) is treated with the anion of a heterocycle  $\text{R}_8$ , generated by reacting  $\text{R}_8$  with a strong base such as  $n\text{-BuLi}$  in a suitable solvent such as THF at a temperature of about  $-30^\circ\text{C}$  to  $-100^\circ\text{C}$  and preferably at about  $-78^\circ\text{C}$ . Deprotection of the resulting ketone provides (VIII). This is coupled with (IV), which is prepared as
- 15 described in Scheme I, under standard coupling conditions such as EDC and HOBT in DMF in the presence of a base such as N-methylmorpholine to provide the desired ketone of formulas (I) or (Ia).

Compounds of the invention where A is a bond (formulas I, Ia and II, IIa) could be

20 prepared in analogous fashion to the Schemes above by using  $\text{R}_1\text{X}$ , where  $\text{X} = \text{Br}, \text{Cl}$ , or

I, instead of an acyl halide ( $R_1C(O)Cl$ ) in Schemes I and II, or by using  $R_1NHC(R_2)(R_3)CO_2H$  instead of (IV) in Schemes III and IV.

Intermediates used in Schemes I-IV are either commercially available or easily prepared by methods known to those skilled in the art. A procedure (Method E) that is useful for preparing substituted oxazoles which may be used as  $R_8$  in Scheme III and IV (Methods C and D) is illustrated below in Scheme V.

Scheme V (Method E)

An N-protected amino acid, for example a *t*-Boc protected amino acid (IX) is coupled with N,O-dimethylhydroxylamine using a suitable coupling agent, such as carbonyldiimidazole (CDI), in a suitable solvent, such as  $CH_2Cl_2$ , THF or DMF, at about 0 °C to provide (X). The N-protecting group is then removed, for example the *t*-Boc group may be removed by treatment with a suitable acid, such as trifluoroacetic acid, in a suitable solvent, such as  $CH_2Cl_2$ . The resulting amine is coupled with the desired carboxylic acid using suitable coupling conditions, such as EDC with HOBT in a suitable solvent such as DMF, in the presence of a base such as N-methylmorpholine to provide a diamide (XI). The N-methoxy-methyl amide is then treated with a suitable reducing agent, such as  $LiAlH_4$  in a suitable solvent, such as THF, to provide an aldehyde (XII). Cyclodehydration (see for example P. Wipf and S. Lim, J. Amer. Chem. Soc., 1995, 117, 558) of (XII) with triphenylphosphine and hexachloroethane in a suitable solvent, such

as acetonitrile in the presence of a suitable base, such as Et<sub>3</sub>N provides the desired oxazole (XIII).

Desired disubstituted thiazoles, which may be used as R<sub>8</sub> in Scheme III and IV (Method  
5 C and D) may be prepared by the Hantzsch method in which a thioamide is condensed  
with an alpha-halocarbonyl compound. This method is known to those skilled in the art  
and is well- documented in the chemical literature (for example, J. Metzger and E.J.  
Vincent, The Chemistry of Heterocyclic Compounds, Vol. 34, 1979; A.R. Katritzky et  
al., J. Org. Chem., 1995, 60, 5638; R. Flaig and H. Hartmann, Heterocycles, 1997, 45,  
10 875).

#### METHODS OF THERAPEUTIC USE

15 The compounds of this invention effectively block degradation of the invariant chain to  
CLIP by cathepsin S, and thus inhibit antigen presentation and antigen-specific immune  
responses. Control of antigen specific immune responses is an attractive means for  
treating autoimmune diseases and other undesirable T-cell mediated immune responses.  
Thus, there is provided methods of treatment using the compounds of this invention for  
20 such conditions. These encompass autoimmune diseases including, but not limited to,  
rheumatoid arthritis, systemic lupus erythematosus, Crohn's disease, ulcerative colitis,  
multiple sclerosis, Guillain-Barre syndrome, psoriasis, Grave's disease, myasthenia  
gravis, scleroderma, glomerulonephritis, atopic dermatitis and insulin-dependent diabetes  
mellitus. The compounds of the invention can also be used to treat other disorders  
25 associated with extracellular proteolysis such as Alzheimer's disease. The compounds of  
the invention can also be used to treat other disorders associated with inappropriate  
autoimmune responses, T-cell mediated immune responses, or extracellular proteolysis  
mediated by cathepsin S, unrelated to those listed above or discussed in the Background  
of the Invention. Therefore, the invention also provides methods of modulating an  
30 autoimmune disease comprising administering to a patient in need of such treatment a  
pharmaceutically effect amount of a compound according to the invention.

For therapeutic use, the compounds of the invention may be administered in any conventional dosage form in any conventional manner. Routes of administration include, but are not limited to, intravenously, intramuscularly, subcutaneously, intrasynovially, by  
5 infusion, sublingually, transdermally, orally, topically or by inhalation. The preferred modes of administration are oral and intravenous.

The compounds of this invention may be administered alone or in combination with adjuvants that enhance stability of the inhibitors, facilitate administration of  
10 pharmaceutical compositions containing them in certain embodiments, provide increased dissolution or dispersion, increase inhibitory activity, provide adjunct therapy, and the like, including other active ingredients. Advantageously, such combination therapies utilize lower dosages of the conventional therapeutics, thus avoiding possible toxicity and adverse side effects incurred when those agents are used as monotherapies. Compounds  
15 of the invention may be physically combined with the conventional therapeutics or other adjuvants into a single pharmaceutical composition. Advantageously, the compounds may then be administered together in a single dosage form. In some embodiments, the pharmaceutical compositions comprising such combinations of compounds contain at least about 15%, but more preferably at least about 20%, of a compound of formulas (I),  
20 (Ia), (II) or (IIa) (w/w) or a combination thereof. Alternatively, the compounds may be administered separately (either serially or in parallel). Separate dosing allows for greater flexibility in the dosing regime.

As mentioned above, dosage forms of the compounds of this invention include  
25 pharmaceutically acceptable carriers and adjuvants known to those of ordinary skill in the art. These carriers and adjuvants include, for example, ion exchangers, alumina, aluminum stearate, lecithin, serum proteins, buffer substances, water, salts or electrolytes and cellulose-based substances. Preferred dosage forms include, tablet, capsule, caplet, liquid, solution, suspension, emulsion, lozenges, syrup, reconstitutable powder, granule,  
30 suppository and transdermal patch. Methods for preparing such dosage forms are known (see, for example, H.C. Ansel and N.G. Popovich, *Pharmaceutical Dosage Forms and*

*Drug Delivery Systems*, 5th ed., Lea and Febiger (1990)). Dosage levels and requirements are well-recognized in the art and may be selected by those of ordinary skill in the art from available methods and techniques suitable for a particular patient. In some embodiments, dosage levels range from about 10-1000 mg/dose for a 70 kg patient.

5 Although one dose per day may be sufficient, up to 5 doses per day may be given. For oral doses, up to 2000 mg/day may be required. As the skilled artisan will appreciate, lower or higher doses may be required depending on particular factors. For instance, specific dosage and treatment regimens will depend on factors such as the patient's general health profile, the severity and course of the patient's disorder or disposition  
10 thereto, and the judgment of the treating physician.

### SYNTHETIC EXAMPLES

#### EXAMPLE 1

**Morpholine-4-carboxylic acid [1-(S)-(1-(S)-cyano-3-phenylpropylcarbamoyl)-3-methylbutyl] amide**  
20

As outlined generally in Scheme I (Method A), *N*-Boc-L-homophenylalanine (0.50 g, 1.79 mmol) was dissolved in 20 mL of DMF which was cooled with an ice-water bath.  
25 1-Hydroxybenzotriazole (HOBt) (0.29 g, 2.14 mmol) and EDC (0.41 g, 2.00 mmol)

were added followed by stirring for 20 min. Ammonium hydroxide was added (0.5 mL) and stirring was continued overnight (16 h). The reaction mixture was diluted with 50 mL of methylene chloride to give a white precipitate. The mixture was filtered and the filtrate was washed with brine (100 mL) followed by saturated bicarbonate (100 mL).

- 5 The organic layer was dried over  $\text{MgSO}_4$ , filtered and concentrated by rotary evaporation to give the corresponding amide (0.45 g, 90%) that was used without further purification.

- Benzyl L-leucine p-toluenesulfonate salt (8.00 g, 20.3 mmol) was dissolved in 20 mL of DMF followed by addition of N,N-diisopropylethylamine (10.61 mL, 60.9 mmol) and stirring under Ar for 15 min. 4-Morpholinecarbonyl chloride (4.55 g, 30.4 mmol) was added and stirring was continued overnight (16 h). The solution was diluted with 500 mL of EtOAc and washed with 3 x 500 mL of water. The organic layer was dried over  $\text{MgSO}_4$ , filtered and concentrated by rotary evaporation to 8.01 g of the crude product. The product was purified by flash chromatography ( $\text{SiO}_2$ , 40% EtOAc/hexane) resulting in a thick oil. This oil (18 g, 53.8 mmol) was dissolved in ethanol (500 mL).  $\text{Pd}(\text{OH})_2$  (642 mg) was added followed by cyclohexene (100 mL). The mixture was refluxed for 45 min at which time TLC indicated consumption of the benzyl ester. The reaction was cooled and filtered through diatomaceous earth and evaporated to dryness to give N-(4-morpholinecarbonyl)-L-leucine as a very thick oil (13 g, 99%) that was used without further purification.
- 10  
15  
20

- N-Boc-L-homophenylalaninamide (from the first paragraph) (114 mg, 0.41 mmol) was dissolved in 10 mL of  $\text{CH}_2\text{Cl}_2$  and 10 mL of trifluoroacetic acid (TFA) was added. Stirring was continued for 30 min at which time the reaction mixture was evaporated to dryness giving the TFA salt of L-homophenylalanine amide. N-(4-morpholinecarbonyl)-L-leucine (100 mg, 0.41 mmol), from above, was dissolved in 10 mL of DMF and cooled by an ice-water bath. HOBt (72 mg, 0.53 mmol) and EDC (102 mg, 0.53 mmol) were added and the mixture was stirred at 0 °C for 15 min. To the cold solution was added the TFA salt of L-homophenylalaninamide as a solution in 5 mL of DMF, followed by addition of N-methylmorpholine (94  $\mu\text{L}$ , 0.86 mmol). The ice bath was removed and the reaction was stirred at ambient temperature overnight (16 h). The reaction was diluted

The filtrates were combined and washed with saturated bicarbonate (100 mL), 1 N HCl (100 mL) and brine (2 x 100 mL). The organic layer was dried over MgSO<sub>4</sub> and concentrated by rotary evaporation to give an oily residue. The residue was chromatographed (SiO<sub>2</sub>, 5% MeOH in CH<sub>2</sub>Cl<sub>2</sub>) to give the  
5 a white solid (130 mg, 78%).

This amide (150 mg, 0.37 mmol) (material from more than one reaction) was dissolved in 2 mL of DMF and cooled to 0 °C with an ice-water bath. To the solution was added  
10 cyanuric chloride (46 mg, 0.37 mmol). The ice bath was removed and the reaction stirred to ambient temperature over the next hour. During the course of the reaction a white precipitate formed. The reaction was diluted with 100 mL of EtOAc and washed with 100 mL of water (3x). The organic layer was dried over MgSO<sub>4</sub>, filtered and concentrated by rotary evaporation to give the crude residue. The residue was purified by

30

- As described generally in Method C, N-(t-Boc)-L-homophenylalanine (10.0 g, 35.8 mmol) was dissolved in 50 mL of DMF. The solution was cooled to 0 °C with an ice-water bath. Carbonyldiimidazole (6.4 g, 39.4 mmol) was added to the reaction solution followed by N-methylmorpholine (3.9 g, 39.4 mmol). The reaction was stirred for 1 h at which time N,O-dimethylhydroxylamine hydrochloride (3.8 g, 39.4 mmol) was added. The ice bath was removed and the reaction was stirred at ambient temperature for 3 h. The reaction solution was poured into 200 mL of 1N HCl and extracted with 200 mL of EtOAc. The organic layer was washed with 2 x 100 mL of 1N HCl, 100 mL of saturated sodium bicarbonate, 2 x 100 mL water, and 2 x 100 mL brine. The organic layer was dried over Na<sub>2</sub>SO<sub>4</sub>, decanted and concentrated by rotary evaporation to give the desired amide as a thick oil (11.1 g, 96% crude) which was used without further purification.
- The amide (3.7 g, 11.5 mmol), dissolved in 20 mL THF was added dropwise over 20 min to a suspension of LiAlH<sub>4</sub> (0.53 g, 13.9 mmol) in 60 mL THF which was cooled to 0 °C in an ice-water bath. The mixture was stirred for 15 min, then quenched with 10 mL of a saturated solution of sodium bicarbonate, diluted with 200 mL water and extracted with 3x100 mL EtOAc. The organic layers were combined and washed with 100 mL 1 N HCl and 2 x 100 mL brine. The organic layer was dried over Na<sub>2</sub>SO<sub>4</sub>, filtered over a pad of diatomaceous earth and concentrated by rotary evaporation. The residue was purified by flash chromatography (SiO<sub>2</sub>, 5% i-PrOH in CH<sub>2</sub>Cl<sub>2</sub>) to give the desired aldehyde as an oily solid (2.4 g, 79%).

To a dry 100 mL flask was added 6-(phenylcarbamoyl)benzothiazole (0.58 g, 2.3 mmol) and THF (12 mL). The reaction mixture was cooled to  $-78^{\circ}\text{C}$  with a dry-ice/acetone bath. *n*-BuLi (2.5 M in hexanes) (1.8 mL, 4.5 mmol) was added dropwise to the reaction mixture. The reaction was stirred for 20 min to give a suspension. A solution of the  
5 above aldehyde (200 mg, 0.75 mmol) in 3 mL of dry THF was added all at once via syringe. The temperature was gradually increased to  $-40^{\circ}\text{C}$  and the reaction was stirred for 3 h at which time TLC showed consumption of the aldehyde. The reaction was quenched at  $-78^{\circ}\text{C}$  by the addition of a saturated solution of  $\text{NH}_4\text{Cl}$  and the product was extracted with 50 mL EtOAc. The organic layer was dried over  $\text{MgSO}_4$ , filtered and  
10 concentrated to give a residue that was purified by chromatography ( $\text{SiO}_2$ , 2% MeOH in  $\text{CH}_2\text{Cl}_2$ ) to give the desired alcohol as a solid (194 mg, 50%).

15 water bath and HOBt (19 mg, 0.14 mmol) and EDC (27 mg, 0.14 mmol) were added and the solution stirred for 20 min. The TFA salt of the *N*-deprotected alcohol from above (prepared by stirring the above *N*-Boc protected alcohol in methylene chloride with TFA at room temperature for 30 min and evaporation to dryness) (57 mg, 0.11 mmol of *N*-Boc precursor) was added to the reaction as a solution in 1 mL of DMF followed by  
20 addition of *N*-methylemorpholine (35  $\mu\text{L}$ , 0.32 mmol). The reaction was stirred for 3 h, diluted with EtOAc and washed with 10 mL 1N HCl and 10 mL saturated bicarbonate and 2 x 100 mL brine. The organic layer was dried over  $\text{MgSO}_4$ , filtered and concentrated. The residue was purified by chromatography ( $\text{SiO}_2$ , 2% MeOH in  $\text{CH}_2\text{Cl}_2$ ) to give the desired coupled product as a white solid (57 mg, 82%).

25

## ASSESSMENT OF BIOLOGICAL PROPERTIES

### Expression and Purification of recombinant human Cathepsin S

Cloning of human cathepsin S:

U937 RNA was subjected to reverse transcriptase / polymerase chain reaction with  
10 primer A (5'cacaatgaaacggctggttg 3') and primer B (5'ctagatttctgggtaagagg 3')  
designed to specifically amplify the cathepsin S cDNA. The resulting 900 bp DNA  
fragment was subcloned into pGEM-T (Promega) and sequenced to confirm its identity.  
This construct was used for all subsequent manipulations. This procedure is typical for  
cloning of known genes and is established in its field.

15

Human Pre-Pro-Cat S was removed from pGem-T vector (Promega, 2800 Woods Hollow  
Rd, Madison, WI 53711) by digestion with restriction enzyme SacII, followed by  
treatment with T4 DNA polymerase to generate a blunt end, and a second restriction  
enzyme digest with SalI. It was subcloned into pFastBac1 donor plasmid (GibcoBRL,  
20 8717 Grovemont Cr., Gaithersburg, MD 20884) which had been cut with restriction  
enzyme BamHI and blunt-ended and then cut with restriction enzyme SalI. The ligation  
mixture was used to transform DH5a competent cells (GibcoBRL) and plated on LB  
plates containing 100ug/ml ampicillin. Colonies were grown in overnight cultures of LB  
media containing 50ug/ml Ampicillin, plasmid DNA isolated and correct insert  
25 confirmed by restriction enzyme digestion. Recombinant pFastBac donor plasmid was  
transformed into DH10Bac competent cells (GibcoBRL). Large white colonies were  
picked from LB plates containing 50ug/ml kanamycin, 7ug/ml gentamicin, 10ug/ml  
tetracycline, 100ug/ml Bluo-gal, and 40ug/ml IPTG. DNA was isolated and used to  
transfect Sf9 insect cells using CellFECTIN reagent (GibcoBRL). Cells and supernatant  
30 were harvested after 72 hours. Viral supernatant was passaged twice and presence of Cat  
S confirmed by PCR of the supernatant.

SF9 cells were infected with recombinant baculovirus at a MOI of 5 for 48-72 hrs. Cell pellet was lysed and incubated in buffer at pH 4.5 at 37 for 2 hours to activate Cat S from pro-form to active mature form (Bromme, D & McGrath, M., Protein Science, 1996, 5:789-791.) Presence of Cat S was confirmed by SDS-PAGE and Western blot using  
5 rabbit anti-human proCat S.

#### Inhibition of Cathepsin S

Human recombinant cathepsin S expressed in Baculovirus is used at a final concentration  
10 of 10nM in buffer. Buffer is 50mM Na Acetate, pH 6.5, 2.5mMEDTA, 2.5mMTCEP. Enzyme is incubated with either compound or DMSO for 10 min at 37C. Substrate 7-amino-4-methylcoumarin, CBZ-L-valyl-L-valyl-L-arginineamide (custom synthesis by Molecular Probes) is diluted to 20uM in water (final concentration of 5uM), added to assay and incubated for additional 10 minutes at 37 C. Compound activity is measured  
15 by diminished fluorescence compared to DMSO control when read at 360nm excitation and 460nm emission.

Examples listed above were evaluated for inhibition of cathepsin S in the above assay. All had IC<sub>50</sub> of 100 micromolar or below.

## Continuation of Box I.2

Present claims 1-42, 45-49 relate to an extremely large number of possible compounds. Support within the meaning of Article 6 PCT and disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the compounds as displayed by formula (I) on page 175, wherein R1 is a 4-morpholino substituent, and compounds as displayed by formula (II) on page 247, the compounds as mentioned in the description on pages 129-146, the examples on pages 157-167 and the "prophetic" compounds on pages 171 and 174.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
